Borehole update

Nicholls, the specialist borehole contractor has now successfully drilled and lined our borehole to a depth of 60 metres cutting through sand and shale to reach the start of clay sub strata.

Water aquifers have been found within this drilled depth.

We now wait for the borehole to stabilise, for debris to be flushed through the water course, after which a temporary submersible pump will be installed. The pump was installed today and will run for up to two weeks after which samples of the water will be taken and sent to an approved laboratory for assessment.

Assuming the water is of acceptable quality a permanent submersible pump with associated pipe work and electrics will be installed. The water will then be pumped into our existing water tank, which will potentially make significant savings on our current metered water supply charges.
